**Abstract:** In this article, it is shown that there is a partitioning of the set of 3-arcs in a projective plane of order three into nine pairwise disjoint Steiner triple systems of order 13. © 2017 Wiley Periodicals, Inc. *J. Combin. Designs* 25: 581–584, 2017

**Keywords:** Steiner triple systems; large sets

## 1. INTRODUCTION AND THE MAIN RESULT

Let  $X$  be a set of  $n$  ( $n \geq 3$ ) points and  $B$  a collection of 3-subsets of  $X$  such that every 2-subset of  $X$  is covered in at most one member of  $B$ , then the system  $(X, B)$  is called a *packing triple system* of order  $n$ . Such a system is said to be *optimal* if there is no any other packing triple system of order  $n$  with a larger collection of 3-subsets. A Steiner triple system  $STS(X, B)$  is an optimal packing triple system of order  $n$  in which every 2-subset of  $X$  is contained in exactly one member of  $B$ . A Steiner triple system of order  $n$  exists if and only if  $n \equiv 1, 3 \pmod{6}$  [5]. A set of  $n - 2$  pairwise disjoint Steiner triple systems of order  $n$  is called a *large set* in which the maximum number of such systems is attained. Existence (or nonexistence) of large sets has been long studied and, in particular, Lu showed [2, 3] the existence of large sets of Steiner triple systems for all  $n \equiv 1$  or  $3 \pmod{6}$ ,  $n \neq 7$ . However, Lu's work was missing the cases for  $n \in \{141, 283, 501, 789, 1, 501, 2, 365\}$  and Teirlinck [4] completed these cases.

Donald L. Kreher asked the following interesting problem in 2011 during one of his talks on transverse  $t$ -designs: Can the noncollinear triples of a projective plane of order 3 be partitioned into disjoint Steiner triple systems? There are 234 noncollinear triples, i.e. 3-arcs, in a plane of order 3 and a Steiner triple system of order 13 contains exactly 26 triples. Therefore, such a partitioning would contain exactly nine Steiner triple systems of order 13 and the answer is in the affirmative as presented in Theorem 1.1.

**TABLE I. Triples in  $C_1$**

1	2	5	8	9	12	1	3	8	2	8	10
2	3	6	9	10	13	2	4	9	3	9	11
3	4	7	1	10	11	3	5	10	4	10	12
4	5	8	2	11	12	4	6	11	5	11	13
5	6	9	3	12	13	5	7	12	6	12	1
6	7	10	1	4	13	6	8	13	7	13	2
7	8	11				1	7	9			

**Theorem 1.1.** *There is a partitioning of the set of 3-arcs in a projective plane of order 3 into nine pairwise disjoint cyclic (or noncyclic) Steiner triple systems of order 13.*

Moreover, there are 52 collinear triples and the set of these collinear triples cannot be partitioned into two disjoint Steiner triple systems of order 13, since a line of the plane generates four triples of which any two cannot be in a Steiner triple system at the same time.

## 2. THE PROOF OF THEOREM 1.1

We assume the reader is familiar with basic definitions related to group actions and combinatorial designs including finite projective planes.

Let  $X$  be a nonempty set of size  $n$ , then we denote by  $G|X$  the action of the group  $G$  on  $X$ . For  $x \in X$  and  $g \in G$ ,  $x^g$  denotes the image of  $x$  under  $g$ . If  $S \subset X$ , then we define that  $S^g = \{x^g \mid x \in S\}$ . Moreover, if  $U \subset 2^X$ , then we let  $U^g = \{S^g \mid S \in U\}$ . An *automorphism* of a combinatorial design  $(X, B)$  is a bijection  $\alpha : X \rightarrow X$  such that  $S^\alpha \in B, S \in B$ . In particular, let  $S_X$  be the symmetric group defined on set  $X$ , then an  $STS(X, B)$  is said to be *cyclic* if there is an automorphism  $\alpha \in S_X$  with a single cycle of length  $n$ .

It is well known that there are up to isomorphism exactly two non-isomorphic Steiner triple systems of order 13, one of which is cyclic [1]. Let  $X = \{1, 2, \dots, 13\}$ , and  $g_0 = (1, 2, 3, \dots, 13)$ , then developing the base blocks  $\{1, 2, 5\}$  and  $\{1, 3, 8\}$  with the cyclic group generated by  $g_0$  gives rise to the cyclic system  $C_1$  in Table I.

Let  $g_1 := (1, 4, 8)(3, 10, 12)(5, 7, 11)$  and  $g_2 := (1, 4, 8)(2, 6, 13)(3, 12, 10)$  be permutations in  $S_X$ , then define the group  $H_1 := \langle g_1, g_2 \rangle$  of order 9. Further, let us define  $\mathcal{P}_1 = \{C_1^h \mid h \in H_1\}$ , then  $(X, \mathcal{P}_1)$  defines a cyclic Steiner triple system of order 13 for any  $P \in \mathcal{P}_1$ . Moreover,  $\mathcal{P}_1$  gives rise to exactly nine pairwise disjoint triple systems, since  $P \cap R = \emptyset$  whenever  $P \neq R$ , where  $P, R \in \mathcal{P}_1$ . There are 234 triples contained in  $\mathcal{P}_1$  and exactly 286 triples in  $2^X$ . The remaining 52 triples come from the lines of  $\pi$  the projective plane of order 3, if  $\mathcal{P}_1$  results in an organization of the 3-arcs of  $\pi$  into pairwise disjoint Steiner triple systems of order 13. Therefore, the next step is to partition the set of these into 13 parts of size 4 such that the union of the four triples in each part is a 4-subset. Such a partitioning is given in Table II. This establishes Lemma 2.1.

**Lemma 2.1.** *The set of 3-arcs in a projective plane of order 3 can be partitioned into nine pairwise disjoint cyclic Steiner triple systems of order 13.*

**TABLE II. 4-subsets defining  $\pi$**

1	2	3	7	1	4	8	9	1	5	6	10
1	11	12	13	2	4	10	11	2	5	8	12
2	6	9	13	3	4	5	13	3	6	8	11
3	9	10	12	4	6	7	12	5	7	9	11
7	8	10	13								

**FIGURE 1.** Lines of  $\pi$  through the point 9

Note that  $H_1$  is a collineation group for  $\pi$ , since both the generators  $g_1$  and  $g_2$  preserve its structure. In particular, each of  $g_1$  and  $g_2$  fixes the points of the lines (pointwise or setwise) through the point 9. See Figure 1.

Now let us consider the noncyclic case. A computer search finds a noncyclic Steiner triple system of order 13 from the 3-arcs of  $\pi$ . The set  $C_2$  of these triples is given below in Table III.

Similar to the cyclic case, let us define  $g_3 := (1, 4, 9)(2, 12, 5)(3, 6, 11)$  and  $g_4 := (1, 4, 9)(3, 11, 6)(7, 10, 13)$  whose cycles are determined from the lines of  $\pi$  through the point 8 (See Fig. 2). Moreover, if  $H_2 := \langle g_3, g_4 \rangle$ , then  $H_2$  is of order 9 and preserves the structure of  $\pi$ . Hence, it is a collineation group for  $\pi$ . Let us also define  $\mathcal{P}_2 = \{C_2^h \mid h \in H_2\}$ , then  $\mathcal{P}_2$  is a partitioning of 3-arcs into nine disjoint Steiner triple systems of order 13. This establishes Lemma 2.2.

**TABLE III. Triples in  $C_2$**

8	11	12	3	8	13	4	7	9	4	8	10
3	6	12	1	6	8	2	7	12	9	12	13
4	5	12	1	3	9	1	5	11	2	3	5
1	2	4	5	10	13	6	7	11	2	11	13
5	6	9	1	10	12	4	6	13	2	8	9
9	10	11	5	7	8	1	7	13	3	7	10
2	6	10	3	4	11						

**FIGURE 2.** Lines of  $\pi$  through the point 8

**Lemma 2.2.** *The set of 3-arcs in a projective plane of order 3 can be partitioned into nine pairwise disjoint noncyclic Steiner triple systems of order 13.*

As discussed above, there are two Steiner triple systems of order 13, up to isomorphism, one of which is cyclic and other noncyclic. In a projective plane of order 3, there are 234 many 3-arcs that can be partitioned into pairwise disjoint Steiner triple systems (as given in Lemmas 2.1 and 2.2), so Theorem 1.1 follows.
